Evidence Lab Seminar: Demystifying Health Economic Analyses

THURSDAY, NOVEMBER 19
12:00 - 1:00 P.M.
124 Trent Hall

Santanu Datta, PhD
Assistant Professor in Medicine
Duke University School of Medicine

Join us for an inaugural methods session hosted by DGHI’s Evidence Lab! There are several forms of economic analyses: cost analysis, cost-benefit analysis, cost-effectiveness analysis, etc. In discussions or proposals, these terms are often used interchangeably. However, for health economists each of these terms have a specific meaning. In the first part of Dr. Datta’s talk, he will demystify economic analyses by explaining health economics terminology and providing examples of the most common forms of economic analysis, including his current collaborations with DGHI investigators. The goal of his talk is to leave you with a good conceptual understanding of health economics and how it may apply to your research and future proposals. In the second part of the talk, Dr. Datta will open the floor to questions and encourage you to apply the economic concepts he covered to your own current health studies, or to future studies.

Whether a project coordinator, PI, researcher, or analyst, there will be useful take-aways to consider in your current or future work. Light lunch will be served.
